

WEB DEVELOPMENT RECRUITMENT TASK

Event Management Website — Landing Page

Task: Design and build a landing page for an event management website. We want to see how you use basic frontend concepts to turn an idea into a clean, responsive and interactive webpage. You are free to choose the event theme, website name, colours and overall design.

What you need to use

HTML and CSS are mandatory. JavaScript is optional, but you can use it to add useful interactions or functionality.

What the page should include

- **Navbar** — basic navigation links such as Home, About, Events and Contact.
- **Hero section** — event or website name, a short tagline and a clear action button.
- **About section** — a short introduction to the event platform.
- **Events section** — show at least three events with an image, event name, short details and date.
- **Contact / CTA section** — give the visitor a way to register, contact or explore further.
- **Footer** — add suitable links, contact details or social links.

Responsive design & animations

The website should work properly on desktop as well as mobile screens. Use Flexbox, Grid and media queries wherever required. The layout should not break or overflow on smaller screens.

Add basic CSS animations or transitions to make the page feel interactive. Hover effects, card transitions, button animations or simple entrance effects are enough. Keep the animations smooth and relevant.

Extra points for JavaScript

JavaScript is not compulsory. Extra consideration will be given for useful features such as a hamburger menu, countdown timer, event filter, slider, modal, form validation, dark mode or another meaningful interaction.

Note: Using JavaScript just for the sake of using it will not add extra value. We will look at what the feature does and whether you understand your implementation.

Submission

Upload the complete project to GitHub and submit the repository link. Keep the project structure clean and include a short README mentioning the project, technologies used and features you added.

Evaluation

Area	Weightage
HTML & CSS fundamentals	20%
UI and creativity	20%
Responsiveness	20%
Animations & interactivity	15%
Code quality	10%
JavaScript functionality	10%
GitHub & README	5%

A few important instructions

1. Use HTML and CSS as the base of the project.
2. **Keep CSS in a separate file. Avoid inline and internal CSS.**
3. The page must be responsive and should be tested on different screen sizes.
4. Use animations and transitions where they actually improve the page.
5. **AI usage should be minimal.** You may use it for guidance, but the project should reflect your own understanding and effort.
6. You should be able to explain the code you have written and make small changes if asked during the review.
7. Do not blindly copy a complete project or submit code you do not understand.
8. Mention any external library or major resource used in the README.
9. Make sure the project runs properly before submitting it.

What are we looking for?

We are not expecting a perfect website from beginners. We want to see your basics, creativity, attention to detail and how willing you are to explore and learn.

Build something you understand and can confidently explain.

Good luck!
